# Python introductions

Thanks to all contributors:

Alison Pamment, Sam Pepler, Ag Stephens, Stephen Pascoe, Matt Pryor, Anabelle Guillory, Graham Parton, Esther Conway, Wendy Garland, Alan Iwi, Matt Pritchard and Tommy Godfrey.

#### **BEFORE WE START (1)**

We cannot teach you Python in a day...

...but hopefully we can show you that it is:

- Human-readable (relatively)
- Useful (even if you only know a bit)
- Flexible (you can use it in many places/ways)

#### **BEFORE WE START (2)**

Teaching materials courtesy of:

http://www.software-carpentry.org/

#### Overview

- Introduction why we recommend Python
- Basics and control flow
- Lists, tuples and slicing
- Input/output
- Strings and text processing
- Functions, libraries and scripts
- Error handling and logging
- Sets, dictionaries and OOP

#### What is Python?

- A simple interpreted language
- Very human-readable with clean syntax
- Making it a very good "learn to programme" language

### Why do we recommend Python?

- It is open source and free
- It is cross-platform (including Windows)
- It can be used for simple scripting through to writing full-blown complex applications
- Many libraries/tools to tackle all kinds of problems
- In the environmental science community it continues to grow in popularity...so we can share code!

#### Python version?

Python has multiple personalities!

Python 3 – new; standard;

Most people updating old code to standard.

Used in this course!

 Python 2.6+ – old; established; Nearing end of life.

**But what changed?** 

E.g. print changed from a statement to a function...

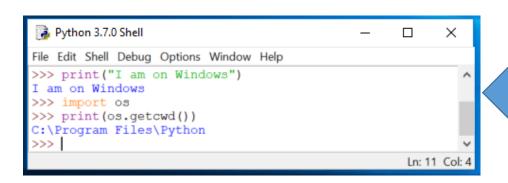

>>> print "hello" # in Python 2.\* to...

>>> **print ("hello")** # in Python

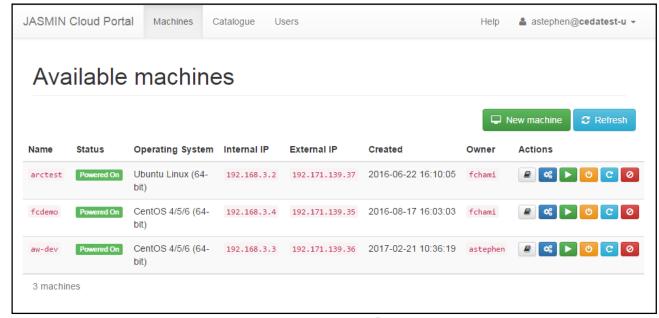

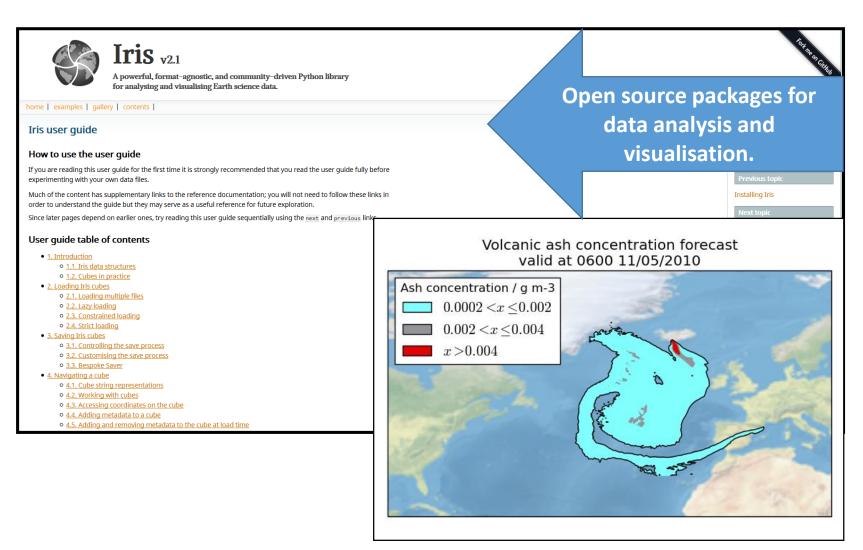

Interactive "shell": allows quick learning/testing/use.

Webprogramming: frameworks make this easy.

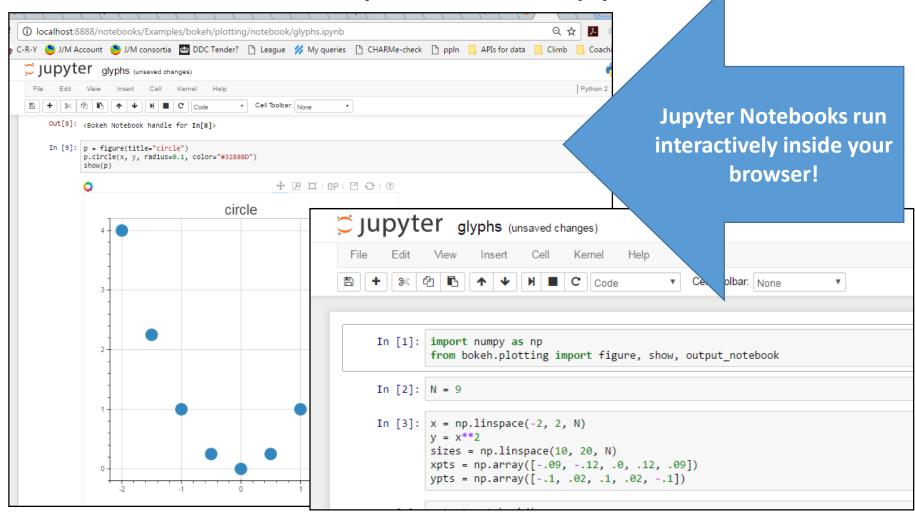

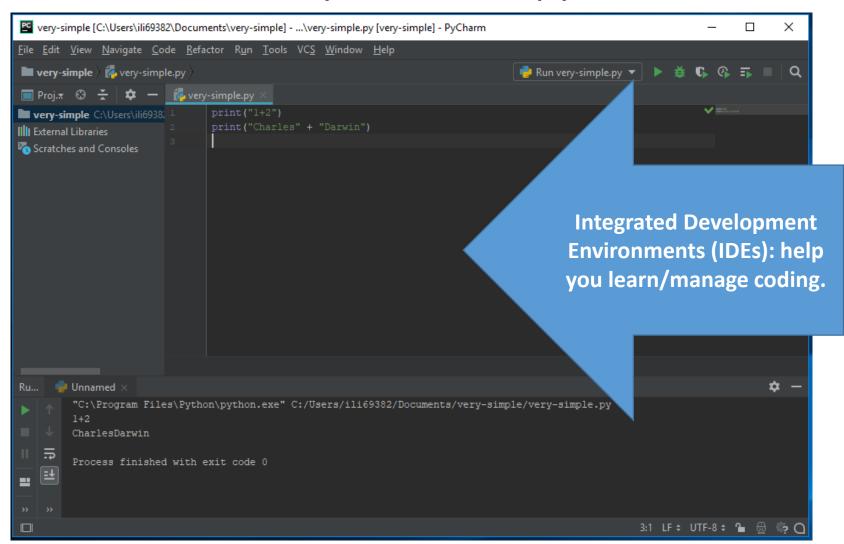

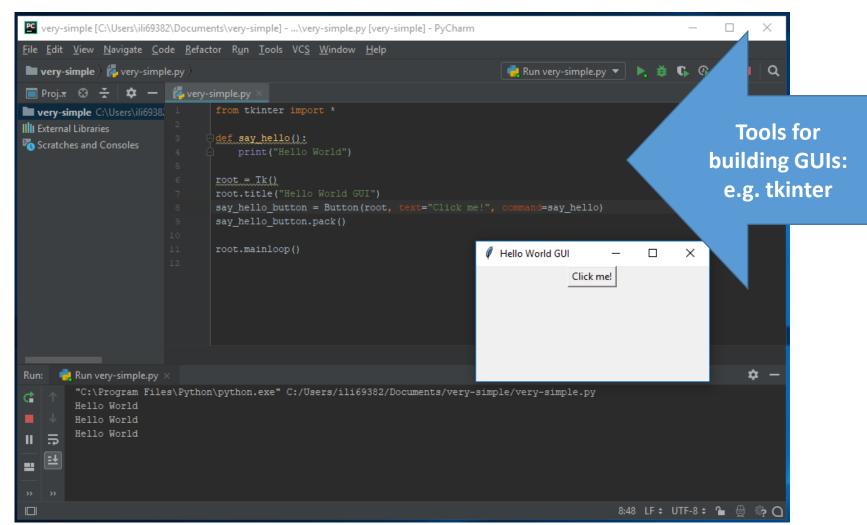

### Let's get to work...
